PROFESSIONAL SUMMARY

Software Development Technician focused on applied Artificial Intelligence, agentic systems and computer vision, with experience implementing AI projects end-to-end — from functional discovery and architecture through development, testing, formal documentation, delivery and client feedback cycles. I am currently part of the AI cell at HitoFusion (Odoo Gold Partner), where I design AI agents and agentic teams for clients in different sectors and serve as an emerging Project Manager on selected projects. Self-driven researcher, active member of the DivisualProject Tribe and a strong believer in continuous learning as a core element of professional practice.

PROFESSIONAL EXPERIENCE

Developer — Artificial Intelligence Cell

November 2025 – Present

HitoFusion (Odoo Gold Partner) — Argentina (Hybrid)

- End-to-end implementation of AI projects covering the full cycle: functional discovery, architectural design, development, testing, formal documentation, delivery and client feedback cycles.
- Development of AI agents and agentic teams applied to real business cases across different sectors (collections, expert advisor, customer support, corporate communication automation, multi-area operations).
- Computer vision projects applied to production lines with demanding precision and reliability requirements.
- Design and implementation of the agentic layer to integrate agents with the corporate ERP (Odoo), managing the data flow and interoperability logic between both systems.
- Emerging Project Manager role on selected projects: requirements gathering, use cases, risk matrices, mitigation plans, technical and commercial meetings with the client, stakeholder reporting and team coordination.
- Formal documentation of processes and solutions, informal mentoring of a recently onboarded team member, and ongoing evaluation of new AI ecosystem tools to recommend to the team.

FEATURED PROJECTS

Computer vision — sub-millimeter precision detection

Industrial sector · End-to-end implementation

- Computer vision pipeline for package detection and millimeter-range deviation calculation (approximately 2-3 mm range), with a demanding quality bar of one failure per 10,000 attempts.
- Model training and project knowledge base generation on a custom dataset.

Multi-area agentic teams

GPS tracking and real-estate sectors · End-to-end implementation

- Design, implementation and production deployment of multi-agent teams serving the operational and commercial areas of companies in each industry, with orchestration across specialized roles and consumption of corporate data.

Email responder agent within a productivity agentic team

Corporate communication automation · End-to-end implementation

- Automated agent connected to the client's corporate email account, integrated into a larger agentic team that also handles information loading and management, and automatic report generation.

TECHNICAL STACK

Agentic Systems: Specialized in the design and implementation of multi-agent architectures with central orchestrator, role-specialized agents (architect, developer, critic, deploy, auditor), quality checkpoints and structured handoffs, working on top of leading agentic engines and platforms to take solutions to production.

LLM Models: Hands-on experience with the leading LLMs on the market (Anthropic Claude family, OpenAI, Google, among others), applying selection criteria by use case, cost and latency, prompt engineering techniques and multi-model orchestration patterns.

MCP, Tool Use & Integrations: Design and consumption of Model Context Protocol servers, structured tool use, RAG and long-term memory patterns. Integrations with enterprise systems, ERPs and official ecosystem APIs (including Meta) to connect agents with external data and services.

AI-Assisted Development: Claude Code as primary CLI in my development workflow, with intensive use of specialized agents, hooks, slash commands and subagents. I maintain a personal library of custom skills, plugins and CLI tools that accelerate repetitive processes and raise the quality of deliverables (skill creation, agent and conversation auditing, prospecting, proposals, automations, dashboards and scraping, among others).

Computer Vision: Design and implementation of applied detection, classification and analysis pipelines on production lines with demanding precision requirements.

Workflow Automation: Multi-step LLM workflows on n8n and MCP-style connectors to enterprise systems — from multi-agent and scoring to scraping, cross-network publishing and API / social network integrations.

Backend, Data & Deployment: Python, Node.js and TypeScript over REST APIs, with relational databases and BaaS platforms, integrations with corporate ERP systems, deployments on Linux VPS with modern auto-deploy platforms, containerization with Docker and basic CI/CD.

Web Frontend: Solid working knowledge of React, Next.js and Tailwind CSS for the interface layer.

EDUCATION & CONTINUOUS LEARNING

Higher Technical Degree in Software Development Graduated: December 2024
Complejo Educativo Brigadier General Estanislao López — Argentina

Active member — Community of practice Ongoing
DivisualProject Tribe — Remote

- Sustained learning on AI development, architecture, security, best practices and documentation, with constant testing of new models and tools, and feedback to the team on what brings real value to the work.

PERSONAL PROJECTS

Jarvis FactorIA / SanAI — AI Agent Factory
Personal research on multi-agent architectures

- Experimental design of a five-layer multi-agent system (human decision-maker, mobile control, orchestrator, execution engine, persistence/knowledge) with quality checkpoints and role-specialized agents.
